

Data sheet for patients with tattoos, permanent Make-up or piercings

Coloured tattoos and permanent-Make-up may contain metal oxides, which can influence the quality of the scan. In the magnetic field of our 1,5 Tesla device, metal oxides may also cause unwanted side effects in the affected skin area, such as skin irritation, sensation of heat and, in very rare cases, burns.

Depending on the material, piercings may also influence the quality of the scan and can lead to side effects in the affected skin area, such as heat sensation and, in very rare cases, burning.

Also magnetic pull and movement of piercings may be possible and, very rarely, skin injury.

I am aware of the side effects and risks mentioned above.
